

# Energy monitoring and targeting software

A typical example of the graphical analysis this produces is shown (left).

John Laing has acquired an energy monitoring and targeting software system called “e-sight”, by Hawkesbury, one of the leading energy software providers.

This system allows the Group instant analysis, graphical reporting and alarming of energy data and trends for the stored and newly-entered data for each of our sites.

The system has remote hosting with fast access and daily data back-up, which will allow central collation and comparison of the energy performance of all our sites and instant feedback of performance.

The system administrators Martin Jameson and Mark Griffiths ensure that the base data such as historical meter readings and meter details are added for each site; users then need only enter their data each month.

Failure to enter data within a limited time creates an alarm through the Equion FM service desk, EQ24/7. Alarms will also be initiated if the energy consumption exceeds set boundaries or is present out-of-hours.

We are also looking at ways of automating our data entry through communications with our site building management systems, where these are connected to the utility meters.
